

Manhattan CB3 Equity Report

Proposed Concept — Version 2

Prepared by CUNY ISLG for Manhattan Community Board 3 | June 2026

Incorporates partner feedback from MCB3 concept presentation, May 2026

What's new in Version 2

- 13 analytical additions and methodological improvements requested by MCB3 partners are integrated throughout — each marked with a ★ NEW or ↑ EXPANDED badge.
- All original content from Version 1 is retained. New content is additive — it extends, rather than replaces, the existing analyses.
- One item (NYU/Sue Kaplan health statistics, item 9) requires clarification from MCB3 on the specific dataset intended. A placeholder is included and noted.

Report Overview

The report will begin by situating Manhattan Community Board 3 (CB3) within the larger context of New York City, highlighting how the district stacks up against other community boards on key demographic and economic metrics. In particular, the FY2027 District Needs Statement for Manhattan CB3 acknowledges that the district ranks #1 of 59 NYC community districts in income diversity. That statistic serves as the framing for the report. Importantly, while CB3 may appear to be doing reasonably well on some citywide indicators at the district level, this top-line picture can obscure deep within-district disparities — and exposing those disparities is the core purpose of the report.

The report will focus on internal inequality, asking: where inside Manhattan CB3 are people best and worst served, and how does this align with demographic distributions? The report will feature a series of metrics across eight domains — housing, economic security, seniors, education, health, environmental conditions, public services, and language access — disaggregating Manhattan CB3 into its 31 census tracts to demonstrate the geographic distribution of need and supports.

This version also integrates, where relevant, the framing and indicator commitments from New York City's Preliminary Racial Equity Plans (PREPs) — providing an official policy lens for interpreting CB3's disparities as structural rather than incidental.

Format

The report will be designed as an interactive, digital data story, with a companion PDF report that mirrors the same content using static visuals. The narrative and findings will be the same across both formats.

Interactive data story

The reader is first introduced to Manhattan CB3 and how it compares to other community boards in the city. A NYC map will show CB3 and the other 58 community districts with interactive layers, while narrative text will call out key cross-district comparisons — including noting where CB3 looks adequate by citywide averages, and why within-district analysis is therefore essential.

After this intro, the data story will focus on within-district disparities across each of the eight domains. Maps of CB3, divided by census tract, will provide a visual representation of how each metric is distributed across CB3. Narrative text will accompany each map to point out key disparities.

As the reader explores the various domain metrics, they can change the tracts to be colored by income, race/ethnicity, age, or English language proficiency, highlighting how the same geography reveals a different equity story depending on what the reader asks about. Readers will also be able to view the data in a table format and download it by census tract and/or community district level.

PDF report

The PDF is a printable companion that follows the same domain-by-domain order. Where the digital version has one interactive map with varied overlays, the PDF has multiple maps for each domain, each shown against the background(s) featured in the narrative. This way, the static version preserves the report's central insight without needing interactivity.

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Cross-Cutting Frame: NYC Preliminary Racial Equity Plans (PREPs) ★ NEW

Throughout the report, where relevant, findings will be situated within the framework of New York City's Preliminary Racial Equity Plans (PREPs), required under Local Law 97 of 2021. Each mayoral agency PREP identifies equity indicators, structural disparities, and city commitments relevant to our domains — including HPD (housing), DOE (education), DOHMH (health), DYCD (youth services), NYC Aging/DFTA (seniors), and DSNY (sanitation). The PREP framework provides city-validated language for interpreting CB3's disparities as the result of historical and structural inequities, strengthening the report's usefulness for MCB3's advocacy work.

Integration approach: A PREP alignment table will appear in the methodology section, mapping each report metric to the relevant PREP indicator. PREP commitments most urgent for CB3's highest-need tracts will be called out in domain narratives. Source: NYC Mayor's Office of Equity, agency PREPs (2023–2025); Mayor Mamdani 2026 racial equity executive order.

Domain 1 — Housing & Affordability

Severe rent burden by tract

The share of CB3 renters spending half or more of their income on rent. Within-CB3 spread: roughly 4× by tract.

Source: 2020–2024 ACS B25070.

Crowded households by tract

The share of CB3 households living in crowded conditions (more than one occupant per room).

Source: 2020–2024 ACS B25014.

Subsidized housing properties at risk of expiration

↑ EXPANDED — MCB3 Partner Feedback, May 2026

The 303 buildings in CB3 that depend on housing subsidies, plotted as points colored by expiration year. The visual emphasizes the 1,036 units at risk of expiring 2025–2030 vs. the 2,754 at risk in 2031–2040.

Expanded: Properties will now be distinguished by subsidy type — NYCHA public housing (~14,900 units), Project-Based Section 8/HAP contracts (PBRA), Low Income Housing Tax Credit (LIHTC, 4% and 9%), HUD Section 202/811 (elderly and disabled), Mitchell-Lama (city and state), HPD Article XI/inclusionary housing, and HOME/CDBG-funded projects. Some properties carry multiple overlapping subsidies. This breakout allows readers to see how subsidy types are geographically distributed across CB3's three NTAs — for instance, the concentration of NYCHA along the waterfront vs. HPD-financed preservation projects elsewhere.

Source: NYU Furman Subsidized Housing Database, May 2025 (program type field); NYC HPD Local Law 44 OpenData.

Supportive housing ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

City-funded supportive housing sites — permanent housing paired with on-site social services for individuals exiting homelessness or living with serious mental illness — mapped as points within CB3, with unit counts reported by NTA. Supportive housing is a distinct and critical segment of CB3's affordable housing landscape, directly connected to CB3's homelessness crisis narrative. CB3's FY2027 DNS explicitly identifies the shortage of Safe Haven beds and supportive

housing as a pressing district need; the Coalition for the Homeless 'State of the Homeless 2025' report confirms supportive housing placements are at near-record lows.

Source: NYC DSS/Office of Supportive Housing (OpenData 'Supportive Housing' dataset, annual); Furman SHD supportive housing program flag; Coalition for the Homeless, State of the Homeless 2025.

New affordable housing construction by target AMI

Recent and pipeline affordable-housing sites plotted as points sized by unit count and colored by their target AMI band (with deeply affordable 0–30% AMI sites in the most prominent color). Only 6 of CB3's 31 tracts have any new affordable construction, and the 0–30% AMI band makes up only 11–16% of new studio/1-BR supply.

Source: Pratt Housing Needs Analysis, June 2025; Furman Subsidized Housing Database filtered to recent subsidy starts.

Housing quality (housing maintenance code violations)

HPD-issued housing maintenance code violations summed to the tract level, with the option to filter to serious (Class B) and immediately hazardous (Class C) violations.

Source: NYC HPD Housing Maintenance Code Violations OpenData (May 2026); HRA Office of Civil Justice Tenant Legal Services Providers list (October 2024); DOHMH Community Health Survey 2022.

Senior housing access: walk-ups and senior-targeted units ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Two sub-panels addressing housing conditions for CB3's large senior population (19.7% aged 65+, highest in Manhattan):

- Walk-up buildings: Properties without elevator access mapped using NYC DCP MapPLUTO (elevator status field) cross-referenced with NYC HPD Building Information System elevator inspection records. Walk-up buildings create significant barriers for seniors and people with mobility disabilities, and are disproportionately concentrated in certain CB3 sub-geographies. Presented with appropriate caveats about data quality for older buildings.
- Senior-targeted affordable units: Count and location of units targeted to seniors (HUD Section 202 and HPD-financed units serving elderly households), drawn from the Furman SHD and HPD Local Law 44 data, filtered to senior population type. Cross-referenced with the AMI mismatch analysis — Pratt (June 2025) finds that the majority of senior single-person households in CB3 earn under 30% AMI, yet very few new affordable units target this band.

Note on wait lists: NYCHA development-level wait list data is publicly available but coarse; HPD Section 8 and DFTA subsidized senior housing wait list data are not publicly available at the tract or community district level. Wait list context will be incorporated as qualitative narrative from CB3's DNS and DFTA sources rather than as a mapped metric.

Source: NYC DCP MapPLUTO (elevator field); NYC HPD BIS elevator inspection records (OpenData); Furman SHD; NYC HPD Local Law 44 OpenData; Pratt Housing Needs Analysis, June 2025.

Domain 2 — Economic Security & Food

Safety-net reliance by tract

Combined Medicaid + SNAP + Cash Assistance enrollment per capita, mapped at tract level. Shows the eastern half of CB3 (LES, Avenue D) carrying disproportionate program reliance.

Source: NYC District Resource Statement, 2024.

Labor market conditions: unemployment and earnings by tract ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Tract-level unemployment rate and median household income mapped side by side — a two-variable story about economic precarity that is stronger than safety-net enrollment alone. The unemployment rate (share of the civilian labor force that is unemployed) is drawn from ACS Table B23025, available at the census tract level, and is expected to show

significant within-CB3 variation: likely ranging from ~3–4% in higher-income East Village tracts to 12–18% in lower-income LES and Chinatown-Two Bridges tracts.

An optional supplemental panel will show median earnings (ACS B20002) disaggregated by race — a potentially powerful racial equity finding. Race-variant tables (B20002A/B/D/H/I) are available at tract level.

Source: 2020–2024 ACS B23025 (unemployment); B19013 (median household income); B20002 and race variants (median earnings).

Food insecurity by tract + emergency food provider locations

Tract-level food insecurity rate as a choropleth, with emergency food provider locations overlaid as points. Provider density does not track need. Cross-district context: Chinatown–Two Bridges ranks 8 of 191 NYC NTAs on food insecurity; East Village ranks 118.

Source: CDC PLACES (2025 release, BRFSS-based tract estimates); NYC OpenData Emergency Food Supply Gap, 2024.

Utility shutoff risk by tract

Tract-level estimated share of households at risk of utility (electric, gas, water) shutoff. Within-CB3 spread is 3.6% in the lowest tract to 24.5% in the highest — a 6.8× ratio.

Source: CDC PLACES (2025 release, BRFSS-based tract estimates).

Domain 3 — Seniors

Senior service supply

The 13 DFTA-funded Older Adult Centers and 8 NORCs in CB3 plotted as points, with the senior-population background showing where seniors actually live.

Source: CB3 DNS appendix; NYC Aging Providers, 2024.

Senior pedestrian safety

77 senior pedestrian incidents across 2024–2025, with the four senior pedestrian fatalities shown larger and red. Top 5 most dangerous intersections (all on Delancey, per CB3 DNS) marked as star icons. Headline: 44% of pedestrian fatalities in CB3 were seniors, despite seniors being only 19.7% of the population.

Source: NYC OpenData Vision Zero Crashes + Person tables joined.

Senior poverty by race

A 4-panel small multiple showing senior poverty rates separately for Asian, Black, Hispanic, and White-not-Hispanic populations, all on the same color scale. Asian senior poverty rate (48.6%) is roughly 1.9× the White-not-Hispanic rate, and Asian residents are disproportionately concentrated among CB3’s senior population.

Source: 2020–2024 ACS B17020 by race.

Domain 4 — Education

Context note (IBO, March 2025): CB3 schools have an average building age of 85 years (vs. 75 citywide); only 21.4% of CB3 schools are fully accessible (vs. ~33% citywide); and no CB3 school has central air conditioning. These findings will appear in the domain narrative.

School PTA fundraising

CB3’s 36 PTA-reporting schools shown as bubbles sized by enrollment, colored by PTA dollars per student.

Source: NYC DOE PTA Financial Reporting 2024–25; LCGMS, April 2026.

Students in temporary housing by school

The same set of CB3 schools shown as bubbles sized by enrollment, colored by STH rate. PS 134 East Broadway in ZIP 10002 has STH rates approaching 50% while neighboring schools in the same ZIP have rates of 5–15% — a stark within-ZIP disparity.

Source: NYC DOE Students in Temporary Housing 2025 report.

3-K, Pre-K, and city-funded childcare seats vs. child population ★ NEW

↑ EXPANDED — MCB3 Partner Feedback, May 2026

Expanded from the original Pre-K analysis to encompass all city-funded childcare for children ages 0–5. Three overlapping program types are shown:

- NYC DOE 3-K for All and Pre-K for All sites (ages 3–5): already in the project library, sized by seat capacity
- NYC ACS-contracted and licensed child care centers (ages 0–5): city-contracted slots vs. privately licensed capacity, drawn from the NYC ACS Child Care Programs OpenData dataset

All sites are mapped against the under-5 population background by tract, allowing readers to see whether childcare seat supply aligns with where young children actually live. This responds directly to CB3's Budget Priorities call for increased childcare funding (Promise NYC, ACS vouchers), and the DNS's identification of childcare as a specific unmet need.

Source: NYC DOE 3-K and Pre-K Locations, April 2026; NYC ACS Child Care Programs (OpenData, licensed/contracted); 2020–2024 ACS B09001 (under-5 population by tract).

Students with IEPs (Individualized Education Programs) ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

The rate of students classified as having a disability and receiving special education services (IEP rate) for each CB3 school, added as a column in the school-level exhibit alongside PTA fundraising and STH rates. This is particularly meaningful given CB3's building accessibility gap — only 21.4% of CB3 schools are fully accessible — creating a structural mismatch between where students with disabilities may need to be served and where accessible buildings exist. District 75 schools (serving students with significant disabilities) are identified separately.

Source: NYC DOE Demographic Snapshot (annual, OpenData — '% Students with Disabilities' field); NYC IBO Barriers to Learning, March 2025; NYC DOE LCGMS (District 75 school flag).

School type distinctions: enrollment type and governance ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

An enrollment-type layer added to the school-level maps, color-coding each school point by its enrollment type and governance model:

- District-zoned schools: serve the surrounding catchment area; resource levels most directly reflect neighborhood conditions
- District-choice / open enrollment schools: draw students from across Community School District 1; equity implications for who has access to higher-resource schools
- Citywide schools (screened or unzoned): draw students from across NYC; may pull higher-income, better-resourced students from the district
- Charter schools: several operate in CB3; relevant for comparing resource levels and demographics
- Transfer schools: serve over-age, under-credited students — an equity-relevant population

This layer allows readers to see whether resource disparities (PTA funds, overcrowding, accessibility) align with school type — a finding with direct policy implications for MCB3 advocacy.

Source: NYC DOE LCGMS (enrollment type field, April 2026); NYC DOE Directory of Public Schools (OpenData, governance type).

Domain 5 — Health

Pediatric asthma + provider locations

Three NTAs colored by pediatric asthma ED visit rate. Federally Qualified Health Center locations and mental health providers overlaid as points.

Source: DOHMH Environment & Health Data Portal; HRSA Health Center locator, April 2026.

Fair or poor general health + FQHCs

Tract-level estimated rate of adults who self-report being in fair or poor general health. Within-CB3 spread: 8.6% in the lowest tract to 44.4% in the highest — a 5.2× ratio. The 18 HRSA Federally Qualified Health Center sites overlaid as points.

Source: CDC PLACES (2025 release, BRFSS-based tract estimates); HRSA Health Center locator, April 2026.

Diabetes prevalence by tract ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Tract-level diagnosed diabetes prevalence among adults, drawn from the same CDC PLACES dataset already used for fair/poor health and uninsured rate metrics. Within-CB3 variation in diabetes prevalence is expected to be significant — preliminary data suggests Chinatown-Two Bridges tracts may show rates 2–3× higher than East Village tracts — and is directly relevant to CB3's large Asian and Hispanic communities, both at elevated population risk. The 18 FQHC sites are overlaid as points to tell a story about chronic disease burden and primary care access. A narrative thread will connect this finding to the food insecurity analysis in Domain 2.

Source: CDC PLACES (2025 release, BRFSS-based tract estimates, 'Diagnosed Diabetes among Adults'); NYC DOHMH Community Health Profile 2022 (cross-validation); HRSA Health Center locator, April 2026.

Life expectancy by tract [pending data confirmation] ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Tract-level life expectancy estimates, a powerful single-metric summary of cumulative health equity. Within NYC, life expectancy varies by up to 10 years across census tracts, and the within-CB3 spread is likely among the most dramatic in Manhattan given the district's income and environmental justice contrasts.

Note: MCB3 partners referenced the NYU / Sue Kaplan World Population Health Statistics as a potential source for this domain. We are seeking clarification on the specific dataset intended. In the interim, the recommended primary source is the CDC/RWJ Foundation U.S. Small-Area Life Expectancy Estimates Project (USALEEP), which provides tract-level life expectancy for all U.S. tracts and has been used in peer-reviewed CB3-area health research. If the MCB3 partners can confirm the specific NYU dataset, we will evaluate it as an alternative or supplementary source.

Source: CDC USALEEP (tract-level life expectancy estimates); NYU College of Global Public Health / Sue Kaplan dataset [to be confirmed]; NYU Langone Health Community Health Needs Assessment, Manhattan (contextual).

Uninsured rate by tract

Tract-level model-based estimate of the share of adults without health insurance. Within-CB3 spread: 3.7% in the lowest tract to 25.1% in the highest. The 18 HRSA FQHC sites overlaid as points.

Source: CDC PLACES (2025 release, BRFSS-based tract estimates); HRSA Health Center locator, April 2026.

Domain 6 — Environmental Conditions

Cross-cutting frame: 22 of CB3's 31 census tracts (75% of the district) were designated 2024 Environmental Justice Areas by the Mayor's Office of Climate & Environmental Justice — making CB3's environmental health story one of the report's most important structural equity findings. The EJ Areas overlay is applied across this domain.

Heat vulnerability + Environmental Justice Areas + street tree canopy

A layered map combining the Heat Vulnerability Index by ZIP, the 2024 Environmental Justice Areas overlay, and individual street trees from the 2015 TreesCount census colored by health status (Good / Fair / Poor). 85% of CB3 is impervious surface; alive tree counts range from fewer than 20 per tract in the eastern corridor to more than 300 in more interior tracts.

Source: DOHMH HVI April 2026; MOCEJ EJ Areas 2024; NYC Parks 2015 Street Tree Census.

Hurricane evacuation zones + at-risk housing infrastructure

NYC Hurricane Evacuation Zones layered as polygons over CB3, with the East River shoreline falling in Zone 1. Cross-overlaid with NYCHA developments and Furman SHD subsidized properties to show how much regulated affordable stock sits in the higher-risk zones.

Source: NYC DCP Hurricane Evacuation Zones (version 26A); NYCHA Facilities and Service Centers; Furman Subsidized Housing Database.

Air quality and pollution sources ★ NEW

★ NEW ADDITION — MCB3 Partner Feedback, May 2026

Tract-level PM2.5 concentrations from the NYC Community Air Survey (DEP/DOHMH), one of the most geographically detailed air quality datasets available in any U.S. city. PM2.5 is the most health-relevant air pollution metric and directly connected to pediatric asthma and respiratory health findings in Domain 5.

Point-source pollution facilities — including ConEd generating and steam facilities (East River Generating Station and others), TRI-reporting facilities, and NYS DEC-permitted stationary sources — are overlaid on the air quality map to show the relationship between industrial infrastructure and pollution burden. This is particularly meaningful given that 22 of CB3's 31 tracts are designated Environmental Justice Areas partly on the basis of pollution burden.

Source: NYC Community Air Survey (DEP/DOHMH, available on NYC OpenData); EPA Toxic Release Inventory (TRI); NYS DEC Air Permit database; MOCEJ EJ Areas 2024.

Sanitation cleanliness

CB3 cleaning sections colored by 12-month rolling Acceptable Streets ratings from NYC Scorecard, with the EJ Areas overlay applied.

Source: NYC Scorecard 2026.

Rodent activity (DOHMH inspection-based) ★ NEW

↑ EXPANDED — MCB3 Partner Feedback, May 2026

Updated from 311 call density to DOHMH Rat Indexing Program (RIP) inspection results — the active infestation rate per inspected property, aggregated to the tract level. The RIP data is inspection-driven rather than complaint-driven, making it a far more equitable and reliable metric than 311 calls, which disproportionately reflect reporting access rather than actual infestation levels.

The 311 divergence finding is retained as a prominent methodological callout: 311 rodent complaints concentrate disproportionately in the higher-income East Village (~48% of CB3 complaints) despite DOHMH survey data showing similar in-home rodent rates across the district — a compelling equity finding about data literacy and reporting access that the narrative will highlight.

Source: NYC DOHMH Rodent Inspection dataset (OpenData, RIP inspection results); DOHMH Community Health Survey 2022 (cross-validation); NYC OpenData 311 Service Requests (retained for methodological callout).

Domain 7 — Public Services

Parks and open spaces: facility inventory by park ★ NEW

↑ EXPANDED — MCB3 Partner Feedback, May 2026

Updated from programming event counts to a facility-type inventory — a more direct measure of what is physically available to residents, regardless of whether programming is offered. CB3's open space deficit (0.7 acres per 1,000

residents vs. NYC median of 1.8 acres and CEQR standard of 2.5 acres) makes it critical to understand what amenities exist within the limited park space available.

Each CB3 park is mapped and coded by its available facility types, including:

- Basketball courts
- Playgrounds (including accessible/inclusive playground designations)
- Pickleball courts (newly converted from tennis in several parks; tracked via NYC Parks capital projects)
- Tennis courts
- Chess and game tables (present at Tompkins Square Park, Columbus Park, and others)
- Athletic fields and recreation centers
- Dog runs and skate parks

A ¼-mile accessibility analysis shows which census tracts have access to each facility type, directly answering the equity question: do residents in lower-income tracts have equitable access to active recreation facilities?

Source: NYC Parks Facilities dataset (OpenData, facility type codes); NYC Parks Capital Projects Tracker; NYC Parks Properties (OpenData); 2020–2024 ACS (tract population denominator).

Public transportation access

Tract-level choropleth showing the share of each tract's area within ¼ mile of a subway entrance, with MTA bus stop density as a secondary point overlay.

Source: NYC OpenData MTA Subway Stations and Bus Stops.

NYPL libraries as civic anchors

New York Public Library Manhattan branch locations within and near CB3 mapped against service area populations, with branch-level program counts and hours as a secondary exhibit.

Source: NYPL Branch Services, April 2026.

Domain 8 — Language Access

LEP household share by language group ★ NEW

↑ EXPANDED — MCB3 Partner Feedback, May 2026

Expanded from a single aggregate LEP choropleth to language-specific maps, directly reflecting CB3's linguistic geography. CB3's DNS reports that 23% of residents speak Asian and Pacific Island languages and 18% speak Spanish — but these communities are geographically differentiated within the district in ways the aggregate map obscures.

Primary maps (one choropleth per language group):

- Chinese (Cantonese and Mandarin combined — the largest non-English language in CB3, concentrated in Chinatown-Two Bridges tracts)
- Spanish (second-largest, concentrated in LES NYCHA developments and portions of the East Village)

Supplementary exhibit: Additional language groups from ACS B16001 including Tagalog, Korean, French Creole, Arabic, Russian, and Vietnamese, shown as a small-multiple panel for readers interested in the full linguistic landscape. ACS B16001 provides ~40 language categories at the tract level.

This language-by-language breakdown directly supports MCB3's advocacy for language-specific services. The DNS calls out Cantonese, Mandarin, and Spanish interpretation as specific priorities; this analysis provides the geographic evidence base for where those services are most needed.

Source: 2020–2024 ACS B16001 (Language Spoken at Home by English Proficiency, ~40 language categories, tract level); ACS C16002 (household LEP by language group, retained for cross-validation).

Senior LEP by language

Tract-level density of CB3's 11,981 Asian/Pacific-language-speaking seniors, 95% of whom are limited English proficient. Cross-tabulated with language group to distinguish Cantonese/Mandarin-speaking from other Asian-language-speaking senior populations.

Source: 2020–2024 ACS B16004 (Age by Language Spoken at Home).

Conclusion

A closing section summarizing the cross-cutting findings across all eight domains. This section will identify the census tracts and neighborhoods where multiple forms of need converge — the 'double and triple burden' tracts where housing precarity, economic insecurity, health disparities, and environmental vulnerability overlap — and will highlight upcoming city initiatives and PREP commitments most directly relevant to CB3's highest-need areas.

The conclusion is an opportunity to link the report's evidence base to MCB3's ongoing advocacy priorities as articulated in the FY2027 District Needs Statement and Budget Priorities.
