

CB3 Equity Report: Proposed Concept

Report Overview

A community-equity report for Manhattan Community Board 3 that disaggregates the district to 31 census tracts and asks, for each of eight domains — housing, economic security, seniors, education, health, environmental conditions, public services, language access — *where inside CB3 are people best and worst served, and how does this align with demographic distributions?* CB3’s FY2027 District Needs Statement acknowledges that CB3 ranks #1 of 59 NYC community districts in income diversity. That framing is the report’s starting point and it goes on to show what that internal inequality looks like, domain by domain.

The report will be designed as an interactive, digital, data story, with a companion PDF report that mirrors the same content using static visuals. The narrative, data, and findings will be the same across both formats.

Interactive data story

The reader is first introduced briefly to CB3 and a single NYC-scale orientation map shows how CB3 compares to the other 58 community districts with interactive layers. This is the only NYC-wide map in the report.

After this intro, the reader starts scrolling, and the map changes to display CB3’s 31 census tracts. This map becomes sticky on one side of the screen. A street layer overlay lets the reader recognize neighborhoods (Delancey, Houston, Avenue B, the Bowery) and orient themselves; tract numbers are visible on hover for those who want them. The reader can change the tracts to be **colored by income, race/ethnicity¹, age², English language proficiency**. The reader picks whichever demographic background they want to see and can switch between options as they scroll through the report.

On the other side of the screen, a column of prose describes CB3 — first as a whole district, then domain by domain. As the reader scrolls past each domain header, the map’s overlay changes so that a new statistic is displayed on top of the demographic background. Each overlay is a within-CB3 measure of how the domain is distributed.

The ability to change the background demographic of interest will allow the reader to understand within-district variation in domains across different demographic characteristics. This design is aimed at highlighting how the same geography reveals a different equity story depending on what the reader asks it about; the narrative text will emphasize areas that readers should note. A reader will also be able to click on any tract to open a small pop-up showing indicators measured at that tract: median income, racial composition, senior population, LEP rate, severe rent burden, asthma rate, all the headline numbers from each domain.

PDF report

The PDF is a printable companion that follows the same domain-by-domain order. Where the digital version has one interactive map per overlay, the PDF has multiple for each: each overlay shown against the background(s) featured in the narrative. This way, the static version preserves the report’s central insight without needing interactivity.

Outline

Introduction

CB3 introduced as one of NYC’s 59 community districts and overview statistics provided. NYC orientation map. Describe how CB3 ranks #1 in income diversity. Setup for what follows: emphasis on within-CB3 variation.

Each domain will feature 2–3 maps with a corresponding narrative story to highlight the findings.

Domain 1 — Housing & Affordability

¹Race has a sub-chooser: % Asian, % Black, % Hispanic, % White-not-Hispanic.

²Age has a sub-chooser: % 65+, % under 18, median age.

- **Severe rent burden by tract:** the share of CB3 renters spending half or more of their income on rent. Within-CB3 spread: roughly 4× by tract. Source: 2020–2024 ACS B25070.
- **Crowded households by tract:** the share of CB3 households living in crowded conditions (more than one occupant per room). Pairs naturally with the rent-burden map and the household-size structure of CB3’s tracts. Source: 2020–2024 ACS B25014.
- **Subsidized housing properties at risk:** the 303 buildings in CB3 that depend on housing subsidies, plotted as points colored by their expiration year. The visual emphasizes the 1,036 units at risk of expiring 2025–2030 vs. the 2,754 at risk in 2031–2040. Source: NYU Furman Subsidized Housing Database, May 2025.
- **New affordable housing construction by target AMI:** recent and pipeline affordable-housing sites plotted as points sized by unit count and colored by their target AMI band (with deeply affordable 0–30% AMI sites in the most prominent color). The visual headline is twofold: only 6 of CB3’s 31 tracts have any new affordable construction, and Essex Crossing alone accounts for more than half of those units. Layering the AMI color tells the second half of the story — that new construction is concentrated in the 51–80% and 81–120% AMI bands, while the band where seniors most need units (0–30%) makes up only 11–16% of new studio/1-BR supply, despite seniors being CB3’s most rent-burdened age group. Source: Pratt Housing Needs Analysis, June 2025; Furman Subsidized Housing Database filtered to recent subsidy starts.
- **Housing quality (housing maintenance code violations):** HPD-issued housing maintenance code violations summed to the tract level, with the option to filter to serious (Class B) and immediately hazardous (Class C) violations. Pairs with the rent-burden and overcrowding maps to surface tracts where pressure on price and space is also paired with pressure on basic livability. Narrative will draw on the DOHMH Community Health Survey 2022 finding that 67.3% of CB3 renters report at least one health-related housing problem, 40.3% report cockroaches, and 34.7% report mice/rats. Source: NYC HPD Housing Maintenance Code Violations OpenData; DOHMH Community Health Survey 2022.

Domain 2 — Economic Security & Food

- **Safety-net reliance by tract:** combined Medicaid + SNAP + Cash Assistance enrollment per capita, mapped at tract level. Shows the eastern half of CB3 (LES, Avenue D) carrying disproportionate program reliance. Source: NYC District Resource Statement, 2024.
- **Food insecurity by NTA + emergency food provider locations** — three CB3 NTAs colored by their citywide food-insecurity rank (Chinatown–Two Bridges ranks 8 of 191 NYC NTAs; East Village ranks 118), with food provider locations overlaid as points. Provider density doesn’t track need. Source: NYC OpenData Emergency Food Supply Gap, 2024.

Domain 3 — Seniors

- **Senior service supply:** the 13 DFTA-funded Older Adult Centers and 8 NORCs in CB3 plotted as points, with the senior-population background showing where seniors actually live. The Avenue C/D corridor shows up as high senior density with notably few service points. Source: CB3 DNS appendix; NYC Aging Providers, 2024.
- **Senior pedestrian safety:** 77 senior pedestrian incidents across 2024–2025, with the four senior pedestrian fatalities shown larger and red. Top 5 most dangerous intersections (all on Delancey, per CB3 DNS) marked as star icons. Headline: 44% of pedestrian fatalities in CB3 were seniors, despite seniors being only 19.7% of the population. Source: NYC OpenData Vision Zero Crashes + Person tables joined.
- **Senior poverty by race:** a 4-panel small multiple showing senior poverty rates separately for Asian, Black, Hispanic, and White-not-Hispanic populations, all on the same color scale. Asian senior poverty rate (48.6%) is roughly 1.9× the White-not-Hispanic rate, and Asian residents are disproportionately concentrated among CB3’s senior population. Source: 2020–2024 ACS B17020 by race.

Domain 4 — Education³

- **School PTA fundraising:** CB3's 36 PTA-reporting schools shown as bubbles sized by enrollment, colored by PTA dollars per student. NEST+m raises 74% of all PTA dollars across CB3; 17 of 36 schools report zero. Source: NYC DOE PTA Financial Reporting 2024–25; LCGMS, April 2026.
- **Students in temporary housing by school:** the same set of CB3 schools shown as bubbles sized by enrollment, colored by STH rate. Within a single ZIP code, the visual reveals one school with a 5% STH rate alongside a neighboring school with a near-50% rate — the within-CB3 disparity narrative made concrete at the school level. Source: NYC DOE Students in Temporary Housing 2025 report.
- **3-K and Pre-K seats vs. under-5 population:** 3-K and Pre-K locations as points sized by capacity, with seats differentiated by program type (3-K vs. Pre-K, since these are separate NYC programs serving different ages). The under-5 population background shows where toddlers actually live. Pairs supply against need at the tract level. Source: NYC DOE 3-K and Pre-K Locations, April 2026; ACS 2020–2024.

Domain 5 — Health

- **Pediatric asthma + provider locations:** three NTAs colored by pediatric asthma ED visit rate (Lower East Side at 423.6 per 10,000 kids 0–4; East Village at 80; the immediately-adjacent SoHo at 49 — a 9× spread crossing one CD boundary). Federally Qualified Health Center locations and mental health providers overlaid as points. Source: DOHMH Environment & Health Data Portal; HRSA Health Center locator, April 2026.
- **Adults without a primary care provider:** tract-level estimated rate of adults reporting no routine checkup in the past year, paired with the 18 HRSA Federally Qualified Health Center sites in CB3. The narrative will note CB3's 11.5% unmet medical care rate (DOHMH CHP 2022) is well above the Manhattan average of 7.1%. Source: CDC PLACES (BRFSS-based small-area estimates), tract-level, most recent vintage.
- **Uninsured rate by tract:** tract-level model-based estimate of the share of adults without health insurance. CB3's 8.6% uninsured rate is more than 2× Manhattan's 3.4%, but the tract-level map will show that this average masks significant within-CB3 variation. The map can be paired with the FQHC locations to show whether the supply of safety-net primary care is positioned to serve uninsured residents. Source: CDC PLACES, tract-level, most recent vintage.

Note: a within-CB3 emergency-department-use rate for adults is not available at tract level from public sources — NYS SPARCS data is typically released at NTA or larger geography. If feasibility allows, NTA-level adult ED rates from SPARCS can be added to this domain. Pediatric ED rates (the headline asthma map) are NTA-level via the DOHMH Environment & Health Data Portal.

Domain 6 — Environmental Conditions⁴

- **Heat vulnerability + indoor environmental complaints:** a layered map combining the Heat Vulnerability Index by ZIP, the 2024 EJ Areas overlay, and 311 indoor environmental complaints as a kernel-density heatmap. The three layers triangulate environmental burden onto the same geography. Narrative will note 85% of CB3 is impervious surface (DNS 2025), a structural driver of heat vulnerability. Source: DOHMH HVI April 2026; DOHMH Indoor Environmental Complaints; MOCEJ EJ Areas 2024.
- **Sanitation cleanliness:** CB3 cleaning sections colored by 12-month rolling Acceptable Streets ratings from NYC Scorecard, with the EJ Areas overlay applied. Source: NYC Scorecard 2026.
- **Rodent activity:** 4,459 rodent-related 311 calls (2020–April 2026) shown as a kernel density. CB3 is one of NYC's four designated Rat Mitigation Zones. The narrative will note the 311-vs-survey divergence as itself an equity finding about reporting access: 311 complaints concentrate disproportionately in the higher-

³IBO's March 2025 Barriers to Learning findings on CB3's school facilities — average building age 85 years (vs. 75 citywide), only 21.4% of CB3 schools fully accessible (vs. ~33% citywide), and no CB3 school with central air conditioning — will live in the prose for this domain rather than as a separate map.

⁴22 of CB3's 31 census tracts (75% of the district) were designated 2024 Environmental Justice Areas by the Mayor's Office of Climate & Environmental Justice. This designation is shown as a hatched overlay on the Environmental Conditions maps, creating a visual through-line for the EJ framing.

income East Village (~48% of CB3 calls), while lower-income Chinatown–Two Bridges generates only ~20% — despite DOHMH CHP 2022 survey data showing similar in-home rodent rates across the three NTAs. Source: NYC OpenData 311 Service Requests; DOHMH Community Health Survey 2022.

Domain 7 — Public Services

- **Parks and open spaces:** park polygons overlaid on tracts with parks programming intensity (Parks Special Events) plotted by park location. Narrative will note CD 3 has 0.7 acres of open space per 1,000 residents; NYC median is 1.8 acres per 1,000 and the CEQR planning standard is 2.5 acres per 1,000. Tompkins Square Park, Sara Delano Roosevelt Park, and Seward Park dominate event activity; smaller western/Chinatown parks see far less programming. Source: NYC Parks Special Events 2026.
- **Libraries and after-school programs:** the 5 NYPL branches as star markers sized by visits or circulation, with DYCD after-school program sites overlaid by total enrollment. Hamilton Fish Park’s branch is currently closed for renovation through Summer 2026, leaving a service gap in a high-need area. Source: NYPL Branch Services, April 2026; NYC DYCD Program Sites, April 2026.

Domain 8 — Language Access

- **LEP household share by tract:** the most dramatic single tract-level visual in the report: the share of households that are limited English proficient ranges from 0.6% to 50.6% across CB3’s 31 tracts, an 84× spread within one community district. The Chinatown core saturates dark; the gentrified East Village blocks barely shade. Source: 2020–2024 ACS C16002.
- **Senior LEP:** tract-level density of CB3’s 11,981 Asian/Pacific-language-speaking seniors (95% of whom are limited English proficient). Source: 2020–2024 ACS B16004.

Conclusion

A short closing section that reassembles the cross-cutting findings: the senior-needs cluster (40.2% of seniors below poverty, 52.4% LEP, 44% of pedestrian fatalities, most rent-burdened age group), the Asian-community-needs cluster (highest senior poverty rate, highest LEP rate, mental health demand following anti-Asian hate), and the environmental justice cluster (22 of 31 tracts designated EJ Areas, with heat, asthma, rodents, and impervious surface burdens reinforcing each other on the same geography).
